

Machine-Level Programming II: Arithmetic & Control

15-213: Introduction to Computer Systems
5th Lecture, Sep. 7, 2010

Instructors:

Randy Bryant and Dave O'Hallaron

Today

- Complete addressing mode, address computation (leal)
- Arithmetic operations
- Control: Condition codes
- Conditional branches
- While loops

Complete Memory Addressing Modes

■ Most General Form

■ $D(Rb, Ri, S) \quad \text{Mem}[\text{Reg}[Rb] + S * \text{Reg}[Ri] + D]$

- D: Constant “displacement” 1, 2, or 4 bytes
- Rb: Base register: Any of 8 integer registers
- Ri: Index register: Any, except for %esp
 - Unlikely you’d use %ebp, either
- S: Scale: 1, 2, 4, or 8 (*why these numbers?*)

■ Special Cases

■ $(Rb, Ri) \quad \text{Mem}[\text{Reg}[Rb] + \text{Reg}[Ri]]$

■ $D(Rb, Ri) \quad \text{Mem}[\text{Reg}[Rb] + \text{Reg}[Ri] + D]$

■ $(Rb, Ri, S) \quad \text{Mem}[\text{Reg}[Rb] + S * \text{Reg}[Ri]]$

Address Computation Examples

%edx	0xf000
%ecx	0x0100

Expression	Address Computation	Address
0x8(%edx)		
(%edx,%ecx)		
(%edx,%ecx,4)		
0x80(,%edx,2)		

Address Computation Instruction

■ **leal Src,Dest**

- *Src* is address mode expression
- Set *Dest* to address denoted by expression

■ **Uses**

- Computing addresses without a memory reference
 - E.g., translation of `p = &x[i];`
- Computing arithmetic expressions of the form $x + k^*y$
 - $k = 1, 2, 4, \text{ or } 8$

■ **Example**

```
int mul12(int x)
{
    return x*12;
}
```

Converted to ASM by compiler:

```
leal (%eax,%eax,2), %eax ; t <- x+x*2
sall $2, %eax             ; return t<<2
```

Today

- Complete addressing mode, address computation (leal)
- **Arithmetic operations**
- Control: Condition codes
- Conditional branches
- While loops

Some Arithmetic Operations

■ Two Operand Instructions:

<i>Format</i>	<i>Computation</i>		
addl	<i>Src,Dest</i>	$\text{Dest} = \text{Dest} + \text{Src}$	
subl	<i>Src,Dest</i>	$\text{Dest} = \text{Dest} - \text{Src}$	
imull	<i>Src,Dest</i>	$\text{Dest} = \text{Dest} * \text{Src}$	
sall	<i>Src,Dest</i>	$\text{Dest} = \text{Dest} \ll \text{Src}$	<i>Also called shll</i>
sarl	<i>Src,Dest</i>	$\text{Dest} = \text{Dest} \gg \text{Src}$	<i>Arithmetic</i>
shrl	<i>Src,Dest</i>	$\text{Dest} = \text{Dest} \gg \text{Src}$	<i>Logical</i>
xorl	<i>Src,Dest</i>	$\text{Dest} = \text{Dest} \wedge \text{Src}$	
andl	<i>Src,Dest</i>	$\text{Dest} = \text{Dest} \& \text{Src}$	
orl	<i>Src,Dest</i>	$\text{Dest} = \text{Dest} \mid \text{Src}$	

- Watch out for argument order!
- No distinction between signed and unsigned int (why?)

Some Arithmetic Operations

■ One Operand Instructions

incl	<i>Dest</i>	$Dest = Dest + 1$
decl	<i>Dest</i>	$Dest = Dest - 1$
negl	<i>Dest</i>	$Dest = -Dest$
notl	<i>Dest</i>	$Dest = \sim Dest$

■ See book for more instructions

Arithmetic Expression Example

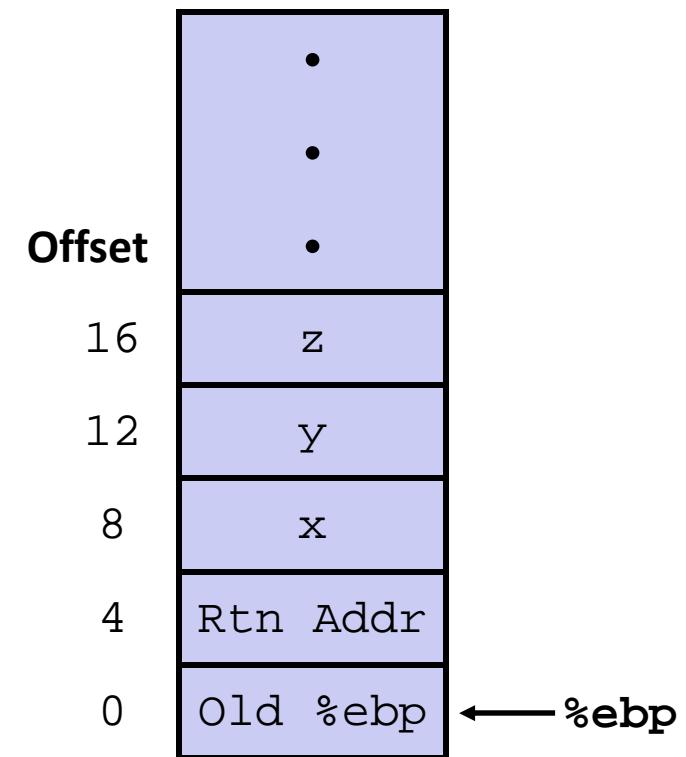

```
int arith(int x, int y, int z)
{
    int t1 = x+y;
    int t2 = z+t1;
    int t3 = x+4;
    int t4 = y * 48;
    int t5 = t3 + t4;
    int rval = t2 * t5;
    return rval;
}
```

arith:

pushl %ebp	}	Set Up
movl %esp, %ebp		
movl 8(%ebp), %ecx	}	Body
movl 12(%ebp), %edx		
leal (%edx,%edx,2), %eax		
sall \$4, %eax		
leal 4(%ecx,%eax), %eax		
addl %ecx, %edx		
addl 16(%ebp), %edx		
imull %edx, %eax		
popl %ebp	}	Finish
ret		

Understanding arith

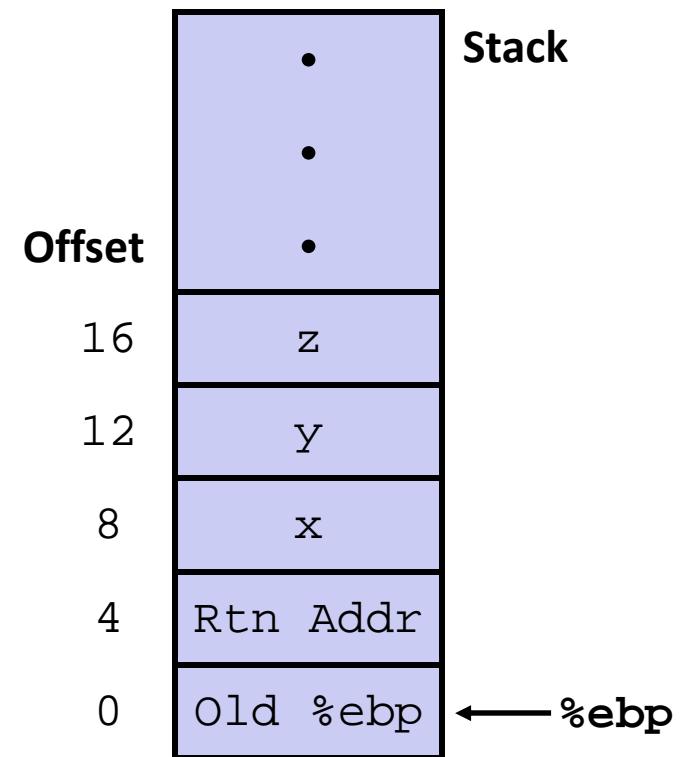

```
int arith(int x, int y, int z)
{
    int t1 = x+y;
    int t2 = z+t1;
    int t3 = x+4;
    int t4 = y * 48;
    int t5 = t3 + t4;
    int rval = t2 * t5;
    return rval;
}
```

```
movl 8(%ebp), %ecx
movl 12(%ebp), %edx
leal (%edx,%edx,2), %eax
sall $4, %eax
leal 4(%ecx,%eax), %eax
addl %ecx, %edx
addl 16(%ebp), %edx
imull %edx, %eax
```

Understanding arith

```
int arith(int x, int y, int z)
{
    int t1 = x+y;
    int t2 = z+t1;
    int t3 = x+4;
    int t4 = y * 48;
    int t5 = t3 + t4;
    int rval = t2 * t5;
    return rval;
}
```

```

movl 8(%ebp), %ecx          # ecx = x
movl 12(%ebp), %edx         # edx = y
leal (%edx,%edx,2), %eax   # eax = y*3
sall $4, %eax               # eax *= 16 (t4)
leal 4(%ecx,%eax), %eax    # eax = t4 +x+4 (t5)
addl %ecx, %edx             # edx = x+y (t1)
addl 16(%ebp), %edx         # edx += z (t2)
imull %edx, %eax            # eax = t2 * t5 (rval)

```

Observations about arith

```
int arith(int x, int y, int z)
{
    int t1 = x+y;
    int t2 = z+t1;
    int t3 = x+4;
    int t4 = y * 48;
    int t5 = t3 + t4;
    int rval = t2 * t5;
    return rval;
}
```

- Instructions in different order from C code
- Some expressions require multiple instructions
- Some instructions cover multiple expressions
- Get exact same code when compile:
- $(x+y+z) * (x+4+48*y)$

movl 8(%ebp), %ecx	# ecx = x
movl 12(%ebp), %edx	# edx = y
leal (%edx,%edx,2), %eax	# eax = y*3
sall \$4, %eax	# eax *= 16 (t4)
leal 4(%ecx,%eax), %eax	# eax = t4 +x+4 (t5)
addl %ecx, %edx	# edx = x+y (t1)
addl 16(%ebp), %edx	# edx += z (t2)
imull %edx, %eax	# eax = t2 * t5 (rval)

Another Example

```
int logical(int x, int y)
{
    int t1 = x^y;
    int t2 = t1 >> 17;
    int mask = (1<<13) - 7;
    int rval = t2 & mask;
    return rval;
}
```

logical:

```
pushl %ebp
movl %esp,%ebp
```

}

Set
Up

```
movl 12(%ebp),%eax
xorl 8(%ebp),%eax
sarl $17,%eax
andl $8185,%eax
```

Body

```
popl %ebp
ret
```

Finish

movl 12(%ebp),%eax	# eax = y
xorl 8(%ebp),%eax	# eax = x^y (t1)
sarl \$17,%eax	# eax = t1>>17 (t2)
andl \$8185,%eax	# eax = t2 & mask (rval)

Another Example

```
int logical(int x, int y)
{
    int t1 = x^y;
    int t2 = t1 >> 17;
    int mask = (1<<13) - 7;
    int rval = t2 & mask;
    return rval;
}
```

logical:

```
pushl %ebp
movl %esp,%ebp
```

}

Set Up

```
movl 12(%ebp),%eax
xorl 8(%ebp),%eax
sarl $17,%eax
andl $8185,%eax
```

Body

```
popl %ebp
ret
```

Finish

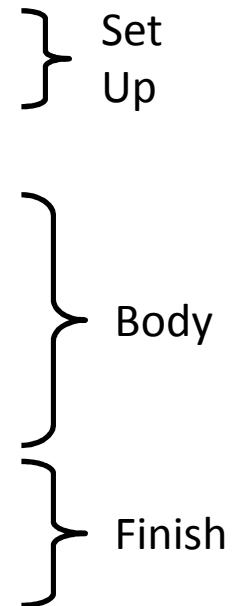

<code>movl 12(%ebp),%eax</code>	# eax = y
<code>xorl 8(%ebp),%eax</code>	# eax = x^y (t1)
<code>sarl \$17,%eax</code>	# eax = t1>>17 (t2)
<code>andl \$8185,%eax</code>	# eax = t2 & mask (rval)

Another Example

```
int logical(int x, int y)
{
    int t1 = x^y;
    int t2 = t1 >> 17;
    int mask = (1<<13) - 7;
    int rval = t2 & mask;
    return rval;
}
```

logical:

```
pushl %ebp
movl %esp,%ebp
```

```
movl 12(%ebp),%eax
xorl 8(%ebp),%eax
sarl $17,%eax
andl $8185,%eax
```

```
popl %ebp
ret
```

movl 12(%ebp),%eax	# eax = y
xorl 8(%ebp),%eax	# eax = x^y (t1)
sarl \$17,%eax	# eax = t1>>17 (t2)
andl \$8185,%eax	# eax = t2 & mask (rval)

Another Example

```
int logical(int x, int y)
{
    int t1 = x^y;
    int t2 = t1 >> 17;
    int mask = (1<<13) - 7;
    int rval = t2 & mask;
    return rval;
}
```

$$2^{13} = 8192, 2^{13} - 7 = 8185$$

logical:

```
pushl %ebp
movl %esp,%ebp
```

} Set Up

```
movl 12(%ebp),%eax
xorl 8(%ebp),%eax
sarl $17,%eax
andl $8185,%eax
```

} Body

```
popl %ebp
ret
```

} Finish

<code>movl 12(%ebp),%eax</code>	# eax = y
<code>xorl 8(%ebp),%eax</code>	# eax = x^y (t1)
<code>sarl \$17,%eax</code>	# eax = t1>>17 (t2)
<code>andl \$8185,%eax</code>	# eax = t2 & mask (rval)

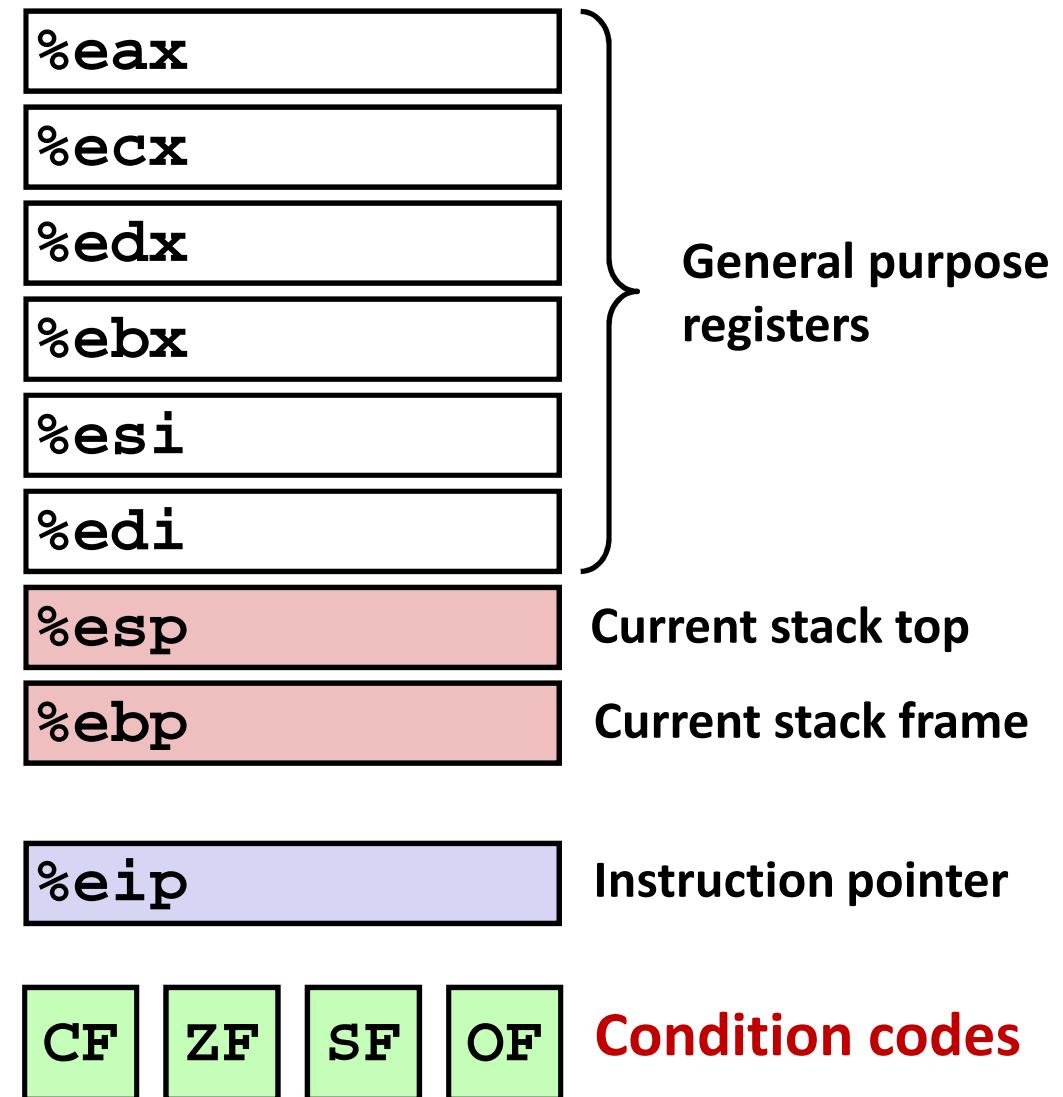

Today

- Complete addressing mode, address computation (leal)
- Arithmetic operations
- **Control: Condition codes**
- Conditional branches
- Loops

Processor State (IA32, Partial)

■ Information about currently executing program

- Temporary data (`%eax`, ...)
- Location of runtime stack (`%ebp`, `%esp`)
- Location of current code control point (`%eip`, ...)
- Status of recent tests (**CF, ZF, SF, OF**)

Condition Codes (Implicit Setting)

■ Single bit registers

- **CF** Carry Flag (for unsigned) **SF** Sign Flag (for signed)
- **ZF** Zero Flag **OF** Overflow Flag (for signed)

■ Implicitly set (think of it as side effect) by arithmetic operations

Example: **addl/addq Src,Dest** $\leftrightarrow t = a+b$

CF set if carry out from most significant bit (unsigned overflow)

ZF set if $t == 0$

SF set if $t < 0$ (as signed)

OF set if two's-complement (signed) overflow

$(a>0 \ \&\& \ b>0 \ \&\& \ t<0) \ \mid\mid \ (a<0 \ \&\& \ b<0 \ \&\& \ t>=0)$

■ Not set by **lea** instruction

■ Full documentation (IA32), link on course website

Condition Codes (Explicit Setting: Compare)

■ Explicit Setting by Compare Instruction

- **cmpl / cmpq Src2, Src1**
- **cmpl b, a** like computing $a-b$ without setting destination
- **CF set** if carry out from most significant bit (used for unsigned comparisons)
- **ZF set** if $a == b$
- **SF set** if $(a-b) < 0$ (as signed)
- **OF set** if two's-complement (signed) overflow
$$(a>0 \ \&\& \ b<0 \ \&\& \ (a-b)<0) \ | \ (a<0 \ \&\& \ b>0 \ \&\& \ (a-b)>0)$$

Condition Codes (Explicit Setting: Test)

■ Explicit Setting by Test instruction

- **testl/testq** *Src2, Src1*

testl b,a like computing **a&b** without setting destination

- Sets condition codes based on value of *Src1 & Src2*

- Useful to have one of the operands be a mask

- **ZF set** when **a&b == 0**

- **SF set** when **a&b < 0**

Reading Condition Codes

■ SetX Instructions

- Set single byte based on combinations of condition codes

SetX	Condition	Description
sete	ZF	Equal / Zero
setne	$\sim ZF$	Not Equal / Not Zero
sets	SF	Negative
setns	$\sim SF$	Nonnegative
setg	$\sim (SF \wedge OF) \& \sim ZF$	Greater (Signed)
setge	$\sim (SF \wedge OF)$	Greater or Equal (Signed)
setl	$(SF \wedge OF)$	Less (Signed)
setle	$(SF \wedge OF) \mid ZF$	Less or Equal (Signed)
seta	$\sim CF \& \sim ZF$	Above (unsigned)
setb	CF	Below (unsigned)

Reading Condition Codes (Cont.)

■ SetX Instructions:

- Set single byte based on combination of condition codes

■ One of 8 addressable byte registers

- Does not alter remaining 3 bytes
- Typically use **movzbl** to finish job

```
int gt (int x, int y)
{
    return x > y;
}
```

Body

```
movl 12(%ebp),%eax      # eax = y
cmpl %eax,8(%ebp)       # Compare x : y
setg %al                 # al = x > y
movzbl %al,%eax          # Zero rest of %eax
```

%eax	%ah	%al
------	-----	-----

%ecx	%ch	%cl
------	-----	-----

%edx	%dh	%dl
------	-----	-----

%ebx	%bh	%bl
------	-----	-----

%esi

%edi

%esp

%ebp

Reading Condition Codes: x86-64

■ SetX Instructions:

- Set single byte based on combination of condition codes
- Does not alter remaining 3 bytes

```
int gt (long x, long y)
{
    return x > y;
}
```

```
long lgt (long x, long y)
{
    return x > y;
}
```

Bodies

```
cmpl %esi, %edi
setg %al
movzbl %al, %eax
```

```
cmpq %rsi, %rdi
setg %al
movzbl %al, %eax
```

Is **%rax** zero?

Yes: 32-bit instructions set high order 32 bits to 0!

Today

- Complete addressing mode, address computation (leal)
- Arithmetic operations
- Control: Condition codes
- **Conditional branches & Moves**
- Loops

Jumping

■ jX Instructions

- Jump to different part of code depending on condition codes

jX	Condition	Description
<code>jmp</code>	1	Unconditional
<code>je</code>	<code>ZF</code>	Equal / Zero
<code>jne</code>	$\sim ZF$	Not Equal / Not Zero
<code>js</code>	<code>SF</code>	Negative
<code>jns</code>	$\sim SF$	Nonnegative
<code>jg</code>	$\sim (SF \wedge OF) \& \sim ZF$	Greater (Signed)
<code>jge</code>	$\sim (SF \wedge OF)$	Greater or Equal (Signed)
<code>jl</code>	$(SF \wedge OF)$	Less (Signed)
<code>jle</code>	$(SF \wedge OF) \mid ZF$	Less or Equal (Signed)
<code>ja</code>	$\sim CF \& \sim ZF$	Above (unsigned)
<code>jb</code>	<code>CF</code>	Below (unsigned)

Conditional Branch Example

```
int absdiff(int x, int y)
{
    int result;
    if (x > y) {
        result = x-y;
    } else {
        result = y-x;
    }
    return result;
}
```

absdiff:

pushl	%ebp	Setup
movl	%esp, %ebp	
movl	8(%ebp), %edx	
movl	12(%ebp), %eax	
cmpl	%eax, %edx	Body1
jle	.L6	
subl	%eax, %edx	
movl	%edx, %eax	Body2a
jmp	.L7	
.L6:	subl %edx, %eax	Body2b
.L7:	popl %ebp	
	ret	Finish

Conditional Branch Example (Cont.)

```
int goto_ad(int x, int y)
{
    int result;
    if (x <= y) goto Else;
    result = x-y;
    goto Exit;
Else:
    result = y-x;
Exit:
    return result;
}
```

- Allows “`goto`” as means of transferring control
 - Closer to machine-level programming style
- Generally considered bad coding style

`absdiff:`

<code>pushl %ebp</code>	{	Setup
<code>movl %esp, %ebp</code>		
<code>movl 8(%ebp), %edx</code>		
<code>movl 12(%ebp), %eax</code>

General Conditional Expression Translation

C Code

```
val = Test ? Then_Expr : Else_Expr;
```

```
val = x>y ? x-y : y-x;
```

Goto Version

```
nt = !Test;
if (nt) goto Else;
val = Then_Expr;
goto Done;
Else:
    val = Else_Expr;
Done:
    . . .
```

- Test is expression returning integer
 - = 0 interpreted as false
 - ≠ 0 interpreted as true
- Create separate code regions for then & else expressions
- Execute appropriate one

Using Conditional Moves

■ Conditional Move Instructions

- Instruction supports:
if (Test) Dest \leftarrow Src
- Supported in post-1995 x86 processors
- GCC does not always use them
 - Wants to preserve compatibility with ancient processors
 - Enabled for x86-64
 - Use switch –march=686 for IA32

■ Why?

- Branches are very disruptive to instruction flow through pipelines
- Conditional move do not require control transfer

C Code

```
val = Test  
  ? Then_Expr  
  : Else_Expr;
```

Goto Version

```
tval = Then_Expr;  
result = Else_Expr;  
t = Test;  
if (t) result = tval;  
return result;
```

Conditional Move Example: x86-64

```
int absdiff(int x, int y) {  
    int result;  
    if (x > y) {  
        result = x-y;  
    } else {  
        result = y-x;  
    }  
    return result;  
}
```

absdiff:

x in %edi

	movl	%edi, %edx	
y in %esi	subl	%esi, %edx	# tval = x-y
	movl	%esi, %eax	
	subl	%edi, %eax	# result = y-x
	cmpl	%esi, %edi	# Compare x:y
	cmove	%edx, %eax	# If >, result = tval
	ret		

Bad Cases for Conditional Move

Expensive Computations

```
val = Test(x) ? Hard1(x) : Hard2(x);
```

- Both values get computed
- Only makes sense when computations are very simple

Risky Computations

```
val = p ? *p : 0;
```

- Both values get computed
- May have undesirable effects

Computations with side effects

```
val = x > 0 ? x*=7 : x+=3;
```

- Both values get computed
- Must be side-effect free

Today

- Complete addressing mode, address computation (leal)
- Arithmetic operations
- x86-64
- Control: Condition codes
- Conditional branches and moves
- Loops

“Do-While” Loop Example

C Code

```
int pcount_do(unsigned x)
{
    int result = 0;
    do {
        result += x & 0x1;
        x >>= 1;
    } while (x);
    return result;
}
```

Goto Version

```
int pcount_do(unsigned x)
{
    int result = 0;
loop:
    result += x & 0x1;
    x >>= 1;
    if (x)
        goto loop;
    return result;
}
```

- Count number of 1's in argument x (“popcount”)
- Use conditional branch to either continue looping or to exit loop

“Do-While” Loop Compilation

Goto Version

```
int pcount_do(unsigned x) {
    int result = 0;
loop:
    result += x & 0x1;
    x >>= 1;
    if (x)
        goto loop;
    return result;
}
```

■ Registers:

%edx	x
%ecx	result

```
        movl $0, %ecx      # result = 0
.L2:   # loop:
        movl %edx, %eax
        andl $1, %eax      # t = x & 1
        addl %eax, %ecx      # result += t
        shr1 %edx          # x >>= 1
        jne .L2            # If !0, goto loop
```

General “Do-While” Translation

C Code

```
do  
    Body  
    while ( Test );
```

Goto Version

```
loop:  
    Body  
    if ( Test )  
        goto loop
```

- **Body:** {
 Statement₁;
 Statement₂;
 ...
 Statement_n;
}

- **Test returns integer**
 - = 0 interpreted as false
 - ≠ 0 interpreted as true

“While” Loop Example

C Code

```
int pcount_while(unsigned x) {  
    int result = 0;  
    while (x) {  
        result += x & 0x1;  
        x >>= 1;  
    }  
    return result;  
}
```

Goto Version

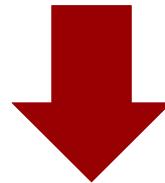

```
int pcount_do(unsigned x) {  
    int result = 0;  
    if (!x) goto done;  
loop:  
    result += x & 0x1;  
    x >>= 1;  
    if (x)  
        goto loop;  
done:  
    return result;  
}
```

- Is this code equivalent to the do-while version?

General “While” Translation

While version

```
while ( Test)  
  Body
```

Do-While Version

```
if ( ! Test)  
  goto done;  
do  
  Body  
  while( Test);  
done:
```

Goto Version

```
if ( ! Test)  
  goto done;  
loop:  
  Body  
  if ( Test)  
    goto loop;  
done:
```

“For” Loop Example

C Code

```
#define WSIZE 8*sizeof(int)
int pcount_for(unsigned x) {
    int i;
    int result = 0;
    for (i = 0; i < WSIZE; i++) {
        unsigned mask = 1 << i;
        result += (x & mask) != 0;
    }
    return result;
}
```

- Is this code equivalent to other versions?

“For” Loop Form

General Form

```
for (Init; Test; Update)  
    Body
```

```
for (i = 0; i < WSIZE; i++) {  
    unsigned mask = 1 << i;  
    result += (x & mask) != 0;  
}
```

Init

```
i = 0
```

Test

```
i < WSIZE
```

Update

```
i++
```

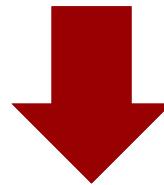

Body

```
{  
    unsigned mask = 1 << i;  
    result += (x & mask) != 0;  
}
```

“For” Loop → While Loop

For Version

```
for ( Init; Test; Update )  
    Body
```

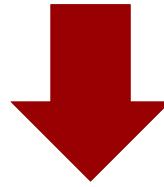

While Version

```
Init;  
  
while ( Test ) {  
    Body  
    Update;  
}
```

“For” Loop → ... → Goto

For Version

```
for ( Init; Test; Update )  
    Body
```

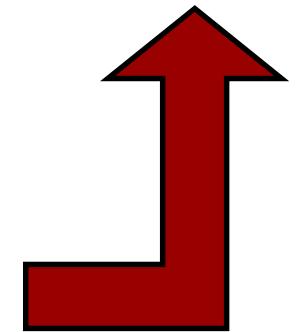

While Version

```
Init;  
while ( Test ) {  
    Body  
    Update;  
}
```

```
Init;  
if ( ! Test )  
    goto done;  
do  
    Body  
    Update  
    while( Test );  
done:
```

```
Init;  
if ( ! Test )  
    goto done;  
loop:  
    Body  
    Update  
    if ( Test )  
        goto loop;  
done:
```

“For” Loop Conversion Example

C Code

```
#define WSIZE 8*sizeof(int)
int pcount_for(unsigned x) {
    int i;
    int result = 0;
    for (i = 0; i < WSIZE; i++) {
        unsigned mask = 1 << i;
        result += (x & mask) != 0;
    }
    return result;
}
```

- Initial test can be optimized away

Goto Version

```
int pcount_for_gt(unsigned x) {
    int i;
    int result = 0; Init
i = 0;
if (!(i < WSIZE)) ! Test
    goto done;
loop:
{
    unsigned mask = 1 << i;
    result += (x & mask) != 0;
}
i++; Update
if (i < WSIZE) ! Test
    goto loop;
done:
    return result;
}
```

Summary

■ Today

- Complete addressing mode, address computation (leal)
- Arithmetic operations
- Control: Condition codes
- Conditional branches & conditional moves
- Loops

■ Next Time

- Switch statements
- Stack
- Call / return
- Procedure call discipline
