

Exam 3 Information

- The final exam for this course will be on Tuesday, 14 Dec 2004, from 12:00–1:50pm.
- This exam is closed book and no calculating devices of any type will be allowed. However the following aides are allowed:
 - Included with this packet is a copy of the relevant “help” files associated with the Super Simple CPU and the CIA and Movie databases. You will be allowed to bring these prepared notes into the exam with you.
 - In addition to the notes provided by us, you may add your own personal notes onto both the front and back of another sheet of paper, for use during the exam. When the exam is over, submit this sheet to the rest of your exam.
- The format of the midterm will be as follows. There will be 14 questions available on the exam. Each student must choose to solve exactly 12 of the 14 questions. Students are free to read all of the questions, and make attempts, before deciding which 12 to select. However the student must explicitly mark which 12 problems are to be graded (if this is not clear, we will assume that the first 12 problems are to be graded).
- The potential coverage of material will be as follows. Approximately 50% of the questions will cover “new” material, that is topics which were introduced since the last exam. Specifically, this range include coverage of lectures from Thursday, 28 Oct 2004 through Thursday, 7 Dec 2004, as well as the associated readings and homeworks for those topics (please see the class schedule for exact coverage).

The remainder of the exam will be cumulative, revisiting *major* topics from the first two-thirds of the course.
- As a sample, we will provide you with the final exam which was used in a past offering of this course, as well as with the solutions to that exam. Keep in mind that the exact coverage of topics varies from semester to semester, so this sample is meant mostly as an example of the *style* of the questions, as opposed to the precise content of the questions.

MORE ABOUT THE SUPER SIMPLE CPU INSTRUCTIONS

=====

1111 STP -- this stops the computer, no more fetch/decode/execute cycles until you reset.

~~~~~

0001 ADD -- fetch a number from memory and add it to the contents of the accumulator, replacing the value value in the accumulator.

E.g. 0001 000000001111 -- get the value at memory location 15 and add that to accumulator.

~~~~~

0010 SUB -- just like ADD, only subtract.

~~~~~

0011 LOD -- fetch a number from memory and store it into the accumulator, replacing its old value.

E.g. 0011 000000001111 -- get the value at memory location 15 and store that value into the accumulator.

~~~~~

0100 LDI -- load immediate; the value to be put into the accumulator is the rightmost 12 bits of the instruction; do not go to memory like LOD

E.g. 0100 000000001111 -- store the value 15 into the accumulator.

~~~~~

0101 STO -- store the accumulator's value into memory at the indicated location.

E.g. 0101 000000001111 -- store the accumulator's value into memory location 15.

~~~~~

0110 INP -- ask the user for one number and store that into the accumulator.

~~~~~

0111 OUT -- copy the value in the accumulator to the output area.

~~~~~

1000 JMP -- jump to the instruction at the indicated memory address.

E.g. 1000 000000001111 -- put the value 15 into the PC which will cause the next instruction to be taken from location 15 of memory.

~~~~~

1001 JNG -- jump to the instruction at the indicated memory location if the accumulator's value is negative; otherwise just add 1 to the PC.

E.g. 1001 000000001111 -- put the value 15 into the PC if accumulator < 0, otherwise go to the next instruction.

~~~~~

1010 JZR -- jump to the instruction at the indicated memory location if the accumulator's value is zero; otherwise just add 1 to the PC.

E.g. 1010 000000001111 -- put the value 15 into the PC if accumulator = 0, otherwise go to the next instruction.

~~~~~
