

## Final Exam Info

During your final exam, you will be developing and submitting a small application in Java. You will be provided with a set of requirements and a class that implements the user interface (GUI) for this application. The user interface class will have the necessary method to display information. However, the GUI class will not do anything as is (there will be buttons, but they will not work). Your task will be to design and implement a class or a set of classes to fulfil the requirements. You will also need to integrate your code with the provided GUI.

You are free to use the internet, code you wrote in the past, and any other non-human resources. One limitation: you cannot post information to the internet. This means that you cannot use the internet to ask somebody else to do the work for you. This includes posting questions on forums, email, chat, etc.

The final exam is worth 200 points.
